WELCOME TO WALTER BLOM PLANTS

Walter Blom Plants focus on finding the very best new breeding in herbaceous perennials and shrubs. As well as supplying premium quality plugs and liners propagated via vegetative propagation. Working closely with existing breeders, such as Must Have Perennials, Darwin Perennials and Walters Gardens we are able to supply you with the exciting new varieties that you will find in this catalogue. We hope you will get as inspired and excited about our products as we are.

As a company we have been focussed on high standards in plant health and we are proud to say that many of our offered varieties have got the highest possible health status, highlighted in the catalogue as VIP (Virus Indexed Plants). Over the last 15 years we have developed our trials and our trial garden where the commercial varieties are growing. It is always possible to visit our trial garden to gather ideas and visualize the varieties in a "Garden Setting". Not only can we show the true garden worthy varieties, but also it allows us to really study the plants carefully year round, so that we for example exactly know how winter hardy every new perennial is.

At Walter Blom Plants we believe that knowledge is the key, the key to being succesful. We like to work closely together with our customers and offer them advise on variety selection and growing. At the same time we like to work together with our breeders and supply chain who offer us their knowledge and expertise. This makes it possible for us to supply robust, true-to-name varieties and well prepared healthy growing material, so that our customers are set up well for succesfull sales and profits.

We export plants from the Netherlands throughout Europe and the UK, USA and Far Eastern Markets. We are MPS Florimark TraceCert certified that show that our plants are traceable for consumers and we show that our products have been processed with care and attention.

Walter Blom Plants BV
Stephen Page

PRODUCT FORMAT: TISSUE CULTURE

PF

TC

Using Tissue Culture where plants are grown on a sterile gel based media, we can rapidly bulk up new varieties or propagate plants previously difficult to root via conventional propagation methods.

The resulting material is referred to as Stage III Tissue Culture or invitro material before it is re-introduced into the real world of the nursery. Alongside a wide range of varieties in our catalogue we undertake a lot of this innovative work on request, so please let us, **Walter Blom Plants**, know if you have ideas for a specific variety.

PRODUCT FORMAT: UNROOTED CUTTINGS

PF

UC

Walter Blom Plants has been working together with Darwin Perennials Colombian production facility for many years to bring the very best quality perennials cuttings to our customers. The foundation of this success is based around the 3 factors: quality, reliability and perennials with staying power.

QUALITY

- Perfect climate for growing perennials.
- Annual renewal of stock and dedicated plant pathology production support.
- New varieties are from proven clean tissue culture.
- Delivered within 72 hours of harvest to offer the freshest cuttings possible.

RELIABILITY

- The farm is 100% dedicated to perennial cutting production.
- With years of experience producing high quality cuttings.
- Long-term focus with respective investments.
- ID tags included shipments for clear identification of Genus, Species and Series.
- Reliable transportation.

PERENNIALS WITH STAYING POWER™

- Broad assortment of trialed and trusted genetics from leading breeders, including Darwin Perennials, Must Have Perennials, Walters Gardens and many more.
- Exciting new introductions of excellent garden and patio perennials
- Perennials with performance for continued and repeat retail sales.

Nowadays, we also work with a large production facility in Kenya. If you are interested in our extensive product list, please contact: marianne@walterblom.nl

Supply of unrooted cuttings must be seen as a separate product and supply chain that cannot be shipped as part of any other order. Therefore only available on special request.

PRODUCT FORMAT: PLUGS, JUMBO PLUGS AND TC PLUGS

PF

P/JP
/TCP

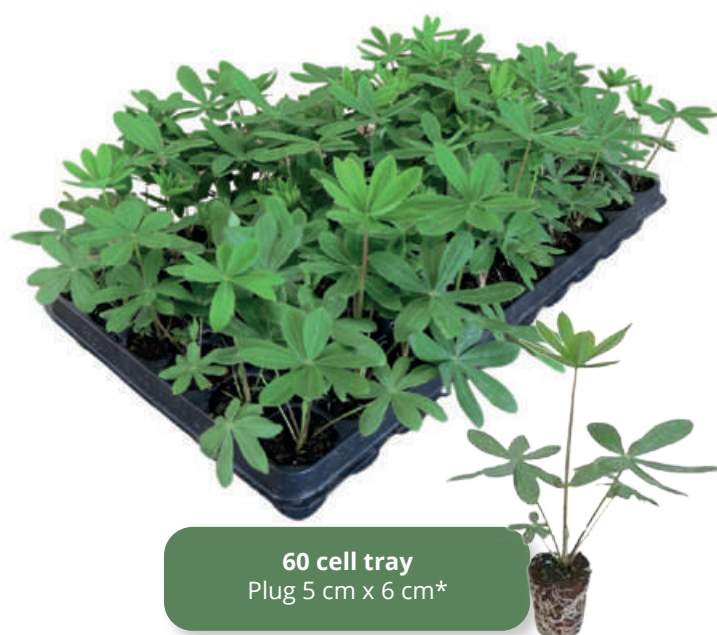

The majority of our varieties will be rooted in a 104 cell tray, this will cover both cutting raised and tissue culture lines. Our products in plug form are offered in one of 4 sizes;

- **3,5 cm plugs** in trays of **104** for the majority of products from both cuttings and tissue culture.
- **3,9 cm plugs** in a **84** cell tray used for varieties such as the Rudbeckia hirta Enchanted, Helleborus and Zantedeschia series.
- **5 cm plugs** in trays of **60** for items such as Alliums, Alstroemeria and Lupines.
- **7 cm plugs** in trays of **28** for overwintered items or for customers looking for faster turnaround times and sales the same season.

Potting dates from early to mid-spring can be sold in the same season. Many varieties are potted from early summer through to early autumn to allow bulking and root development before a winter vernalisation period. This ensures a full pot in spring as underground shoots are sent up from that overwintered root system.

28 cell tray

104 cell tray
Plug 3,5 cm x 5 cm*

* diameter x deep

PRODUCT FORMAT: BARE ROOTED

PF

BR

For the bare rooted products we work with a dedicated small group of growers in different areas of The Netherlands. This helps us source plants grown on the best possible soil (sandy, loam or peat based) to supply vigorous, top quality plants. Most varieties are divisions of 1 year old plants and are graded as follows.

UNDIVIDED ROOTS

Complete undivided roots for larger pot sizes. Due to their size these are often impossible to clean for export outside of Europe.

SUBSTANTIAL DIVISIONS

- Size 1 is a division suitable for pot size up to 2 litre pots (17 cm)
- Size 2 is a smaller division suitable for pot size 9-12 cm

Certain Perennials notably Astilbe, Hosta and Paeonia are graded on Nose Count.

FROM THE COLD STORE AND OTHERS

We can offer the option to deliver a range of these plants in May/early June out of our Cold Store. This will allow fast growth, quick establishment, but also summer seeds and the plants will give multi nose crowns well established in the pot for early sales the following year.

PAEONIA

Is a product that requires early planting for the best results, when planted in the early Autumn the roots will develop allowing the potted Paeonia to start new shoot growth in late winter. This results in the best regrowth and highest chance of flower development the following spring. Please note that Paeonia will need at least 2 to 3 years in the garden before the full size and beauty of the flowers will be seen.

TIMING CHART PER PRODUCT FORMAT:

| Product | Size | Per Crate | Pot Size | When to Plant | Average To Finish |
|-------------------------------|-------------|-----------|-----------|-----------------------------|-------------------|
| Bare Rooted Perennials | | | | | |
| General | Undivided | | 3-5 ltr | Late summer to early spring | 6 -10 weeks |
| | 1 | | 12-17 cm | Late summer to early spring | 8 to 12 weeks |
| | 2 | | 9-12 cm | Spring | 6 to 8 weeks |
| Astilbe | 1-2 Nose | 200 | 9-12 cm | Week 5-24 | 8 to 12 weeks |
| | 2-3 Nose | 150 | 15-17 cm | Week 5-24 | 8 to 12 weeks |
| | 4/+ Nose | 40 | 19-21 cm | Week 5-24 | 8 to 12 weeks |
| Hosta | Jumbo | 150 | 19-23 cm | Week 46-24 | 8 to 14 weeks |
| | 1 Nose | 250 | 15-17 cm | Week 46-24 | 8 to 14 weeks |
| | 2nd Grade | 400 | 9-12 cm | Week 46-24 | 8 to 14 weeks |
| Paeonia | 5-8 Nose | 40 | 5-7,5 ltr | Week 38-46 (later possible) | Saleable Apr-May |
| | 3-5 Nose | 75 | 3-5 ltr | Week 38-46 (later possible) | Saleable Apr-May |
| | 2-3 Nose | 100 | 2-3 ltr | Week 38-46 (later possible) | Saleable Apr-May |
| | 1-2 Nose | 150 | 9-15 cm | Week 38-46 (later possible) | Saleable Feb-Mar |
| Plug Perennials | | | | | |
| 104 cell tray | 3,4 cm plug | 104 | ≤2 Ltr | Early Spring/Spring | 6 to 10 weeks |
| | | 104 | ≤3 Ltr | Early Spring/Spring | 8 to 10 weeks |
| 84 cell tray | 3,9 cm | 84 | ≤2 Ltr | Early Spring/Spring | 6 to 10 weeks |
| | | 84 | ≤3 Ltr | Early Spring/Spring | 8 to 10 weeks |
| 60 cell tray | 4,6 cm | 60 | ≤3 Ltr | Early Spring/Spring | 8 to 10 weeks |
| 28 cell tray | 7 cm | 28 | ≤5 Ltr | Early Spring/Spring | 6 to 10 weeks |

For early spring pot sales: varieties that die back over winter potting weeks are 24 to 34. Varieties that remain wintergreen potting weeks are 28 to 44.

FREQUENTLY ASKED QUESTIONS

IS THERE A MINIMUM ORDER?

There is no specific minimum euro amount required. Any transport or shipping costs will be charged at cost.

- Within Europe the quantity is per box, crate or Danish Trolley. We would suggest working with a minimum of one full trolley to save costs:
 - ◊ Plugs : 44 trays per Danish Trolley
 - ◊ P9's : 49 trays per Danish Trolley
 - ◊ Bare Roots : 40 boxes per Pallet
- Outside of Europe the minimum order via airfreight is a value for plants of € 3000,00 sent FOB.

WHEN IS THE BEST TIME TO ORDER?

The earlier you order, the more chance you have the plants are available. We are always happy to enter a future order in case the varieties you are interested in turned out to be sold out.

- Plugs: minimum lead time 8-10 weeks
- Tissue Culture Plugs: minimum lead time 16-20 weeks

CAN I MAKE CHANGES TO MY ORDER?

Yes, we would be happy to help you if it is possible, but notice the minimum lead times for different products. Please refer to our terms and conditions and/or send an email to sales@walterblom.nl.

HOW WILL MY ORDER BE SHIPPED?

Orders will be shipped via reliable transport companies and airlines. If you have a preference, please inform us when you place your order. Within mainland Europe we use Danish Trolleys where both transport company and customer have to exchange at point of delivery.

WHAT TIME OF YEAR DO YOU TYPICALLY SHIP?

In principle we ship plants all year round to many destinations all over the world, but it is always depending on variety, availability and destination.

WHAT DO YOU CHARGE FOR SHIPPING?

All our prices are Ex Warehouse Hillegom, The Netherlands. Shipping and transport charges will be charged at cost.

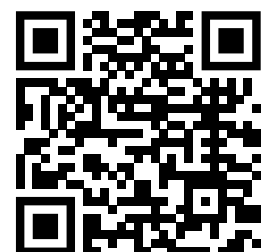

CAN YOU SUPPLY US WITH LABELS?

We can supply labels on request for a small range of our plants. Please contact us for availability and prices. But we do have an extensive photographic library and we would be happy to provide you as customer with images to create your own labels.

HOW DO I GENERATE A REFUND FOR DAMAGED PLANTS?

If you have a concern about your shipment when it arrives, be sure to note any damages on the shipping documents when you sign. Furthermore, digital photos of the damage need to be sent within 24 hours after you received your plants, together with a written statement of the damage. We prefer that date and time are stated on the photos. Please be as specific as possible to report the damage. Credit will be issued for plants and royalties only, no freight will be credited. Late claims made after 72 hours may be respectfully declined.

For more information look at the Ordering Guidelines at our website <https://www.walterblom.nl/shop/ordering-guidelines/>

Actaea *[Bugbane]*

Late flowering perennials that require a constant moisture level in humus rich soils. These slow growing perennials will establish into substantial clumps forming impact in the garden border or woodland garden. Great foliage and a long flowering period.

Achillea *(Yarrow)*

These long flowering perennials perform extremely well in pot sizes 17 to 19 cm and are best grown from vernalised plugs or as an overwintered crop. Good colours on sturdy plants. They grow well in full sun and in poorer soils. Need some moisture but have good drought tolerance. Avoid waterlogged soils.

Excellent plant for the perennial border, attracts bees and butterflies. Provides good flowers for both cutting and drying.

Centaurea *[Knapweed]*

Free flowering perennials that appreciate regular dead heading to extend the flowering period. Grow in full sun in the front area of the border where they can cover the ground very effectively. Often with attractive foliage that highlights the flowers. Very effective cut flower.

Cordyline

Cordyline stands out with its striking foliage color and modern, architectural appearance. This robust perennial grows to a height of approximately 1.2 meters, forming a dense clump of narrow, lance-shaped leaves. Its fresh, colourful foliage provides a vibrant impression all year round. With excellent drought tolerance, it is a reliable choice in a variety of conditions.

Hemerocallis *[Daylily]*

Hemerocallis are in general robust, reliable and self-sufficient plants. Our cultivars have all been tested for their flower power and growth under northern European growing conditions over 3 or more years. As the name suggests individual flowers last no more than one day but with multiple flower spikes and 8 to 10 flowers per stem they can make 300 to 500+ flowers during the indicated flowering period.

Iris

We have selected the following varieties: *Iris ensata* (Japanese Iris) has very large, spectacular flat, open flowers up to ±20 cm. Ideal for wet areas as pond edges. *Iris germanica* (Bearded Iris), has large flowers with a characteristic beard that attracts insects and is suitable in sunny areas with poor soil. *Iris siberica* (Siberian Iris) is very strong and easy-to-grow plant with smaller but numerous flowers. Suitable for moist to normal soil.

Liatris *[Blazing Star]*

Liatris is available in two grades, the cheaper seed raised option which shows variability in height and flowering or the far better vegetative selection that is multiplied purely via division. Plants form a low clump of grassy looking leaves, bearing spikes of bright magenta-purple flowers that open from the top down beginning in midsummer. This selection is compact in habit, especially useful in tubs or mixed containers.

Itoh Paeonia *(Garden Candy®)*

Intersectional or ITOH peonies are a cross between herbaceous (*Paeonia lactiflora*) and woody-stemmed tree peonies (*Paeonia suffruticosa*). ITOH peonies, named after the first person who successfully made the cross, Dr. Toichi Itoh, a Japanese Botanist, combine the best of all traits. The plants are resistant to most pests and diseases, have huge flowers in many colors, and a mounded habit with leaves that die back to the ground. They will also flower from Scandinavia to Southern Europe.

The Garden Candy® series from innovator Don Smith brings colour, joy, and easy growing to gardeners. Their deliciously named, beautifully formed flowers will be eye and garden candy for all to enjoy. The colours, the shapes, and the exceptional consistency make this the first series of ITOH peonies offered to the world with high-quality plants.

PROTECTED PLANTS

EU/PPAF

Once the EU Plant Breeders Rights (EU APP) or US Patent (PPAF) has been granted, a variety is assigned a EU# or PP#. Propagation without a license and export outside of either Europe or North America is prohibited for all EU applied and protected plants and all US patent-pending and patented plants rectively.

All advertisements (including electronic) for patent-pending and patented plants must list the appropriate European PBR or US patent information. In addition to listing the patent information, labels for all varieties that are either EU applied or granted and US patent-pending and patented plants must also state that propagation is prohibited.

PLANT HEALTH

Walter Blom Plants is committed to improving the Health Status of all the stock we have been selling since 2010. All varieties we introduce are tested for all viruses relevant to that Genus. We work with the NAKT in Holland to identify all viruses known to affect a Plant Genus such as Phlox and then we test for those prior to build up our mother stock.

VIRUS INDEXED PLANTS

A virus indexed variety VIP in the catalogue is a variety that has been tested and deemed free of the viruses it was tested for up to the point of testing. We do not claim varieties are free of viruses we use the best knowledge available to identify all viruses that have been found to cause a problem in any genus and use PCI testing of our mother material before initiation into tissue culture for all those pathogens. That means we are certain that every plant that originates from this material is of the highest possible health status. Every aphid brings with it the risk of re-infection but we make every effort to ensure you receive the very highest quality material.

Varieties that have been through this process can be identified by the following VIP-symbol throughout the catalogue.

MPS FLORIMARK TRACECERT

We are certified under the Florimark TraceCert requirements for freshness, entry checks, stock management and distribution. With this vignette we show that our plants are traceable for consumers and have been processed with care and attention.

- Specifically developed for traders and wholesalers
- Meets traceability requirements
- Part of the MPS-Florimark Trade chain certificate

HOW TO TREAT YOUR PLANTS AFTER ARRIVAL

BARE ROOT PLANTS

Immediately or short after your plants have arrived, open all boxes and inspect the condition of the bare root plants. They should be firm, relatively dry and in general light brown in colour. In case any roots are still frozen, allow them to defrost slowly in a cool (4-10 degrees Celsius) room before handling. Do not plant them immediately in a warm greenhouse. If any roots are dry, soak them in a bucket of water mixed with a small amount of soluble fertilizer for one hour before potting. This will help plants get established more quickly.

Transplant all bare root plants as soon as possible. If you are not able to transplant the plants immediately, store them in a cool (1-7 degrees Celsius) area for a limited time. Be sure to have all plant labels at hand when potting to ensure correct identification. The highest priority for transplanting bare root plants should be with all evergreen types, such as Iberis, Lavandula and Phlox subulata types.

PLUGS

When your shipment arrives, immediately inspect the condition of the plugs. Depending on the time of year and the variety, the plants could be dormant or leafed out. In case plugs arrive frozen, allow them to defrost slowly in a cool (4-10 degrees Celsius) room before handling. Do not plant the plugs immediately into a warm greenhouse. If any plugs are dry when they arrive water them immediately. Keep them sufficiently moist and then water the plugs again just before transplanting.

Watering plugs just before transplanting is a critical step not to be missed!!

If you have a mixed shipment of bare root plants and plugs, always make sure you pot up your bare root plants first and then your smallest size plugs.

GROWING ON

We suggest potting up your new perennial liners in a well-drained potting mix for optimum growth as a number of excellent bark or peat-based soilless commercial mixes are available. Most perennials grow best when potted with their crown at the soil surface. If the roots are too long to fit in the pot they generally can be trimmed a bit to fit. For optimal rooting, most perennials should be grown in full sun. For shade loving plants such as Astilbe, Hosta and Dicentra 50-70% shade is recommended. All recently transplanted perennials must be protected and kept away from frost. If the roots are subjected to cold and wet conditions for an extended period of time, they may deteriorate or rot. Do not plant directly outside until all danger of frost is past. Losses due to frost, excessive rainfall or overwatering are the responsibility of the customer and Walter Blom Plants can not be held responsible for damages as a result of these circumstances. Most perennials prefer to be grown at 8-12 degrees Celsius for 10-14 days after potting to promote root growth and then grown at 12-15 degrees Celsius until they are finished. Lower temperatures may be used to delay or suspend growth, while warmer temperatures generally help to accelerate growth.

AUTUMN PLANTING AND OVERWINTERING

Factors such as soil moisture, temperature fluctuations and root development in the container can affect plant survival. Since there are so many variables beyond our control, we cannot possibly guarantee survival of plants overwintered in containers or in the ground. Overwintering success depends on having well-rooted, established plants by the end of the growing season. Poorly rooted plants tend to overwinter poorly. Plan the right delivery time for your bare roots and plugs so they are well-rooted in their containers by the time winter arrives. Feel free to ask for our advice. Perennials with evergreen foliage should not be cut back going into winter, but perennials with dormant foliage should be cut back before overwintering. Most perennials prefer to have moist roots going into winter since the moisture helps to insulate the roots and prevent desiccation. When deciding when to cover your plants for winter, be sure to monitor weather conditions closely. Night time temperatures nearly freezing allow the plants to harden off before covering but if the forecast predicts night time temperatures below zero degrees Celsius, it is time to cover your plants. Do not cover plants before they are hardened off.

At all times: protect your plants from freezing over the winter!
